3D Culling and Clipping

Hidden Surface Elimination

Popular Algorithms

- Back-Face Culling
- Z-Buffer (Depth-Buffer) Algorithm
 - Frame Buffer (Color Buffer) 와
 - Z-Buffer (Depth-Buffer) 를 사용
- BSP Tree 알고리즘
(BSP: Binary Space Partitioning)

Back-Face Detection

FIGURE 9-1 A surface normal vector $\mathbf{N}$ and the viewing-direction vector $\mathbf{V}_{\text{view}}$.

FIGURE 9-2 A polygon surface with plane parameter $C < 0$ in a right-handed viewing coordinate system is identified as a back face when the viewing direction is along the negative z_v axis.

Color Buffer and Depth Buffer

Depth-Buffer Algorithm

1. Initialize the depth buffer and frame buffer so that for all buffer positions (x, y) ,

$\text{depthBuff}(x, y) = 1.0, \quad \text{frameBuff}(x, y) = \text{backgndColor}$

2. Process each polygon in a scene, one at a time.
 - For each projected (x, y) pixel position of a polygon, calculate the depth z (if not already known).
 - If $z < \text{depthBuff}(x, y)$, compute the surface color at that position and set

$\text{depthBuff}(x, y) = z, \quad \text{frameBuff}(x, y) = \text{surfColor}(x, y)$

After all surfaces have been processed, the depth buffer contains depth values for the visible surfaces and the frame buffer contains the corresponding color values for those surfaces.

z-buffer

Z-Buffer Algorithm

frame buffer

z-buffer

b: background color
S: square's color
T: triangle's color

Depth Computation for Planes

$$z = \frac{-Ax - By - D}{C}$$

$$z' = \frac{-A(x + 1) - By - D}{C}$$

$$z' = z - \frac{A}{C}$$

$$x' = x - \frac{1}{m}$$

$$z' = z + \frac{A/m + B}{C}$$

FIGURE 9-5 From position (x, y) on a scan line, the next position across the line has coordinates $(x + 1, y)$, and the position immediately below on the next line has coordinates $(x, y - 1)$.

FIGURE 9-6 Scan lines intersecting a polygon surface.

FIGURE 9-7 Intersection positions on successive scan lines along a left polygon edge.

Accumulation Buffer

FIGURE 9-8 Viewing an opaque surface through a transparent surface requires multiple color inputs and the application of color-blending operations.

(a)

(b)

FIGURE 9-9 Two possible organizations for surface information in an A-buffer representation for a pixel position. When a single surface overlaps the pixel, the surface depth, color, and other information are stored as in (a). When more than one surface overlaps the pixel, a linked list of surface data is stored as in (b).

Axis-Parallel BSP Tree

General BSP Tree

Scan-Line Method

FIGURE 9-10 Scan lines crossing the view-plane projection of two surfaces, S_1 and S_2 . Dashed lines indicate the boundaries of hidden surface sections.

FIGURE 9-11 Intersecting and cyclically overlapping surfaces that alternately obscure one another.

Depth-Sorting Method

- 투영후 겹치지 않는 경우:
아무 순서로 그려도 상관 없다.

- 깊이 범위가 다른 경우:
먼 쪽의 물체를 먼저 가까운 쪽을 나중에.

- 앞뒤 관계가 분명한 경우:
P를 먼저 그리고, Q를 나중에 그린다.

- 깊이가 겹치는 경우:
 - (a) Q를 먼저 그리고, P를 나중에 그린다.
 - (b) P를 절단하여 순서를 결정한다.
 - (c) R을 절단하여 순서를 정한다.
